Instruction:

1) The ProgMods tab can be copied (as required) to create multiple ProgMods tabs, according to the programming module in the study

2) Update the "Title" of the ProgMods to be descriptive (e.g. 5A.Baseline Characteristics)

3) List the newly added ProgMods tab(s) in Section C of the Cover tab

4) Delete any examples in grey italic text that are not relevant/applicable to the study once the programming specification has been finalized

(Initials + Date)

Figure. Identification of a tandem autologous HSCT.

Figure. Identification of a single autologous HSCT.

The patient level sct dataset contains the dates for a patient's processed autologous (auto) and allogeneic (allo) transplant, and CAR-T (cart).

For some patients, there is often a period of sct-related claims activity indicating a workup prior to the actual sct.

For example a patient may have the following sct-related claims (and their dates of service):

Patient A AUTO sct-related dates: 01MAY2018, 02MAY2018, 04MAY2018, 05MAY2018, 07MAY2018, 08MAY2018, 09MAY2018, 06NOV2018, 07NOV2018, 10NOV2018, 11NOV2018, 13NOV2018, 14NOV2018

When processing a patient's sct-related claims and determining the actual sct date, we set the date of the sct to equal the date of last sct claim occurring in a 14 day window from the first sct claim date. In the Patient A example above, 01MAY2018 started the 14 day window during which we would choose the latest sct claim in that 14 day window (the claim on 09MAY2018) as the actual date of Patient A's first sct. Note that while Patient A had additional sct-related claims occurring after 09MAY2018, these claims occurred after the end of the 14 day window.

Furthermore, we require all 'selected' sct dates (the date we've chosen as the actual sct and not workup) to be at least 60 days apart.

In Patient A example above, the first 'selected' sct date is 09MAY2018. Any sct-related claims occurring within 60days of this selected date are not processed (effectively have been skipped over). For Patient A, the next sct-related claim is on 06NOV2018 which is 60+ days after the 'selected' 09MAY2018 sct date and thus will be processed (and in fact starts a new 14 day window).

If the 14 day window overlaps with the date equal to 180 days after the patient's previous sct, then we set the sct to be equal to the claim date that is as close to the 180 day date as possible. We want to allow for tandem AUTO scts that occur within 180 days of each other. Patient A's first sct date is 09MAY2018, we skip over any sct-related claims within 60days of this 'selected' date (there are not any) and we start a new 14 day window beginning on first sct-related claim on 06NOV2018. We would normally 'select' the last sct-related claim occurring during this 14 day window as the date of the actual sct, but we note that this 14 day window occurs partially within the 180 day tandem window from the selected 09MAY2018 sct date. For simplicity, assume that 09NOV2018 marks 180 days after 09MAY2018. Thus, when processing this group of sct-related claims occurring during the 14 day window beginning on 06NOV2018, we 'select' the claim on 07NOV2018 as the date of the actual sct, even though it is not the latest claim in the 14 day window (14NOV2018). Again, we making this adjustment to allow for a tandem to be appropriately captured (that is, the workup to the tandem started within 180d of our previously selected sct date).

Given that the time window to identify a patient's first sct is between their LOT1_START_DT and ENDDATE, scts identified may end up not being in a patient's LOT1 if their LOT1 ends earlier due to non-sct related reasons.
