Hi Onkar,

Following up after my discussion with the study team.

1. The team is potentially interested in excluding patients who have mono- or combo-therapy LOT1 regimens that include either pomalidomide, elotuzumab and/or panobinostat. Would it be possible to get a breakdown of how many patients have any of these agents are included in their LOT1 regimen?
2. Can I see a few patient examples (using the raw claims, before MAPs have been derived) of patients who have pomalidomide included in their LOT1 regimen?
3. Amongst all patients in the cohort who do not receive a steroid at LOT1, can we see who of these patients received a steroid within 7, 14, and 30 days prior to the start of their LOT1?
4. And similarly for LOT2, amongst all patients in the cohort who do not receive a steroid at LOT2, can we see who of these patients received a steroid within 7, 14, and 30 days prior to the start of their LOT2?
5. For patients that have no steroid classified as part of their LOT2 regimen though receive a steroid in the month prior to LOT2 start, did these patients receive a steroid as part of their LOT1? (want to check that the steroid appearing in the month prior to the start of LOT2 is not actually attributable to the LOT1 regimen).
6. Are there patients that receive CART prior to or during their LOT1? Our current LOT rules do not allow CART during LOT1, though the team is wondering if there are any patients where this was actually the case. If so, could we see patient journey examples (using the raw claims) of these patients?

Thank you,
Julia
